

## Output Buffers 5V out

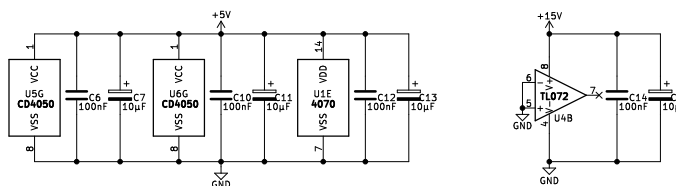

## Alternative output stage for 10V output.

(replace the CD4050 buffers with this circuit)

## IC Power And Unused Inputs Management

\*Note, I use the 5 Volt rail of my power supply. If you don't have a dedicated 5 volt rail, find a 5 Volt regulator(78L05 should be fine but I would use something beefier like Lm7805 to be safe) and use the examples found in the datasheet to set up your own 5 volt rail.
